

# Eastman™ resin intermediates for interior can coatings

Polyester resins are increasingly seen as viable substitutions for epoxy resins for interior can coatings. There are two key performance criteria for interior can coatings — chemical resistance and flexibility. Unfortunately, common flexibilizing intermediates such as adipic acid and 1,6-hexanediol imparts poor chemical resistance to the final can coating.

## Cycloaliphatic performance

Cycloaliphatic intermediates, such as Eastman™ CHDA and CHDM, possess an excellent balance of flexibility and hardness. Because of these unique properties, these materials are able to provide flexibility to an interior can coating without sacrificing chemical resistance.

As shown in Table 1, Eastman™ CHDA offers a distinct performance advantage in hardness/flexibility, balance, and chemical resistance over traditional intermediates such as adipic acid or isophthalic acid.

Table 1

### Comparison of AD, Eastman™ 1,4-CHDA and PIA in a polyester-melamine enamel<sup>a</sup>

|  | AD           | 1,4-CHDA    | PIA         |
|--|--------------|-------------|-------------|
| <b>Flexibility/hardness</b>                      |              |             |             |
| Impact resistance                                |              |             |             |
| Direct, in.-lb                                   | >160         | 156         | 76          |
| Reverse, in.-lb                                  | >160         | 96          | 64          |
| Pencil hardness to mar <sup>b</sup>              | HB           | 2H          | 4H          |
| <b>Stain and chemical resistance<sup>c</sup></b> |              |             |             |
| Iodine after 30 min                              | M            | N           | N           |
| Mustard after 24 h                               | VS           | N           | N           |
| 50% NaOH after 9 h                               | N            | N           | N           |
| 50% H <sub>2</sub> SO <sub>4</sub> after 9 h     | M            | N           | N           |
| <b>Corrosion resistance</b>                      |              |             |             |
| Detergent resistance after 10 days               |              |             |             |
| Creepage, in. (mm)                               | 0.75 (19.05) | 0.13 (3.18) | 0.06 (1.59) |
| % Gloss retention at 60°                         | 30           | 99          | 96          |
| % Gloss retention at 20°                         | 16           | 90          | 86          |
| Blistering                                       | S            | M           | VS          |
| Cracking   | N            | N           | N           |

<sup>a</sup>Resin: NPG/TMP/Diacid/PIA (1.97/0.30/1.00/1.00); Polyester: Cymel 303 ratio = 79.21

<sup>b</sup>Pencil hardness scale from least to most hard: HB, F, H, 2H, 3H, etc.

<sup>c</sup>Effect scale: N = none, VS = very slight, S = slight, and M = moderate

A combination of Eastman™ 1,4-CHDA and CHDM can be used to prepare a coating with a good balance of hardness and flexibility while maintaining chemical resistance as demonstrated by the coil coating formulation shown in Table 2.

## Hydrolytic stability

Another distinct performance advantage offered by cycloaliphatic intermediates is hydrolytic stability. As shown in Figure 1, a CHDA diester is more resistant to hydrolysis under acid or base conditions than the corresponding adipic acid diester.

Figure 1

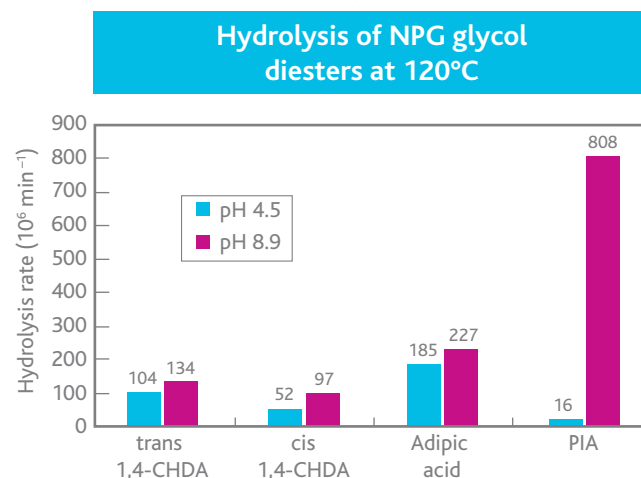

Table 2

## Eastman™ 1,4-CHDA and CHDM modified polyester-melamine coating<sup>a</sup>

| Initial film properties                                 |                          |
|---|--------------------------|
| Film thickness, mils (microns)                          | 0.75 (19)                |
| Flexibility hardness                                    |                          |
| T-bends   | With grain/against grain |
| Initial   | 1T/0T                    |
| Overbake, 30 sec @ 260°C (500°F)                        | 3T/2T                    |
| Wet heat, 30 sec in boiling water                       | 2T/2T                    |
| Reverse impact resistance @ 40 in.-lb (4.5 N-m), % pass | 100                      |
| Pencil hardness to mar <sup>b</sup>                     |                          |
| Initial   | 2H                       |
| 30 min boiling water test, min to recovery              | 15                       |
| Stain and chemical resistance <sup>c</sup>              |                          |
|   | Covered/uncovered        |
| Iodine after 30 min                                     | 3/4                      |
| Mustard after 24 h                                      | 4/5                      |
| Ketchup after 24 h                                      | 5/5                      |
| Grape juice after 24 h                                  | 5/5                      |
| Etch resistance after 8 h                               |                          |
| 50% NaOH  | 5/5                      |
| 50% H <sub>2</sub> SO <sub>4</sub>                      | 5/5                      |
| Corrosion resistance                                    |                          |
| Detergent resistance @ 74°C (165°F)                     | 5 days/10 days           |
| Creepage detected                                       | none/none                |
| % Gloss retention at 60°                                | 96/69                    |
| % Gloss retention at 20°                                | 74/24                    |
| Blister size <sup>d</sup>                               | 8/6                      |
| Blister frequency <sup>d</sup>                          | 4/2                      |
| Cracking <sup>c</sup>                                   | 5/5                      |

<sup>a</sup>Resin: NPG/CHDM/AD/PIA/PTA/Eastman™ CHDA (molar ratio: 6.36/4.24/1.00/2.00/2.00/5.00)  
Polyester: Cymel 301 ratio = 90:10

<sup>b</sup>Pencil hardness scale from least to most hard: HB, F, H, 2H, 3H, etc.

<sup>c</sup>Effect scale: 5 = no effect, 1 = severe effect

<sup>d</sup>ASTM Method D 714, evaluating degree of blistering of paint

Blister size rating: 10 = no blisters; 2 = large blisters

Blister frequency: 5 = none; 1 = dense

## Regulatory status

In the United States, under regulations administered by the U.S. Food and Drug Administration, Eastman™ 1,4-CHDA and CHDM may lawfully be used for the manufacture of polyester resins to be used in food contact coatings as described in 21 CFR 175.300. The use of CHDM for this purpose is based on Food Contact Notification FCN 87.

In Europe, CHDM is listed in Directive 2002/72/EC as Ref. No. 13390 (1,4-bis(hydroxymethyl)cyclohexane) with no specific migration limit for the manufacture of food contact plastic articles. Eastman™ 1,4-CHDA is listed as Ref. No. 14876 (1,4-cyclohexanedicarboxylic acid) in Directive 2002/72/EC with a specific migration limit of 5 mg/kg food, and it is restricted to be used only for the manufacture of polyesters used for food contact plastic articles.
