1.0 INTRODUCTION

This Draft Soil Management Plan (SMP) describes the actions to be taken to ensure that polychlorinated biphenyl (PCB)-containing residual soils within Operable Unit 1 (OU-1)/OU-2 will not pose a threat to human health and the environment, and if these residual soils are disturbed, the materials will be managed appropriately. These activities will be conducted as part of Pharmacia LLC (Pharmacia) and Solutia Inc.'s (Solutia, [collectively, P/S']) overall responsibility for long-term residuals management at the Anniston PCB Site (the Site). This SMP includes procedures for P/S to follow when notified that a land-disturbing activity is planned in a location where PCB-containing residual soils may be found. Land-disturbing activities are any activities that disturb or relocate more than one cubic yard of PCB-containing residual soils.

The OU-1/OU-2 area consists of both residential and nonresidential properties within the Site upstream of Highway 78, up to and surrounding the OU-3 area, as shown in Figure 1. The lateral study bounds for the nonresidential portions of OU-1/OU-2 were generally established based on the limits of Snow Creek's 100-year floodplain and drainage areas downstream of the 11th Street Ditch. Snow Creek is a small urban drainage way that flows through the City of Anniston into the City of Oxford, Alabama, before its confluence with Choccolocco Creek just south of Interstate 20. Two areas outside of the floodplain are also included in OU-1/OU-2—one just southwest of the Facility located proximate to former landfill operations, and a second just south of Highway 78 in the Oxford Lake Neighborhood (OLN) area. The study area boundary has been divided into 30 different geographical areas, termed exposure units (EUs). Soil management will be required to address land-disturbing activities within each of the EUs with the exception of those EUs that have an exposure point concentration (EPC) less than 1 milligrams per kilogram (mg/kg), as highlighted in Table 1. EPCs represent concentrations to which receptors may be exposed for a given area. PCB EPCs were calculated for individual EUs as the upper one-sided 95% confidence level of the arithmetic mean (95% UCL) of the surface soil PCB data.

Other nonresidential areas including the 11th Street Ditch that were historically addressed under the Administrative Order on Consent (AOC) between the United States Environmental Protection Agency (EPA) and Solutia (EPA, 2001) are also located within the OU-1/OU-2 area. In addition to addressing properties within the geographic extents described herein, this SMP will address select properties located outside of these boundaries that were identified during the Feasibility Study (FS) process for OU-1/OU-2 as requiring long-term soil management.

With regards to conducting soil management activities, P/S reserve all rights and defenses they may have to dispute both the source of contamination and the appropriateness of P/S' responsibility to perform any or all soil management as a part of this SMP.

This SMP will be updated at least every five years consistent with the 5-year Comprehensive Environmental Response, Compensation, and Liability Act reviews (CERCLA 5-yr reviews), as needed. The EPA must approve all revisions to this SMP. Additionally, the data summary figures included in the attached appendices will be updated on a yearly basis as new data are collected.

2.0 GEOGRAPHICAL AREAS AND PROPERTIES SUBJECT TO THIS SMP

This SMP applies to land-disturbing activities performed within the study area boundaries for OU-1/OU-2 and at select properties, located outside of these boundaries, identified through the OU-1/OU-2 FS process. For residential properties, Appendix A provides a list of the specific properties within OU-1/OU-2 that will be addressed by this SMP. The residential properties included represent properties where removal actions have been completed by P/S under the terms of the Time-Critical Removal Order (EPA, 2001) and the NTC Removal Agreement/Stipulation and Agreement (EPA, 2006), but residual PCBs remain in subsurface soil (12 inches or more below the existing ground surface) between 1 and 10 mg/kg or potentially beneath structures located on the property. These residential properties include single and multi-family dwellings, apartment complexes, vacant lots in areas zoned residential by local authorities, and the high activity areas of Special Use Properties including schools, churches, day-care centers, community centers, playgrounds, and parks. Specifically, high activity areas consist of the playground area of a public park; the outdoor play or recess areas of a school, community center, or day-care center; and similar areas of any church property, generally comprised of areas less than one quarter acre in size.

This SMP also addresses nonresidential properties, public rights-of-way and utility corridors (linear facilities) located within the OU-1/OU-2 study area boundary. As shown in Table 1, an EPC for PCBs was determined for each of the EUs based on the surface soil samples collected from the EU. Soil management will be required to address land-disturbing activities within each of the EUs with the exception of those EUs that have an EPC less than 1 mg/kg. These EUs are highlighted in Table 1.

Appendix B provides an overview map and map books showing the geographical areas (EU boundaries) and the individual properties covered by this SMP. The figures include the EU boundaries, floodplain limits, and PCB concentration data within the OU-1/OU-2 EUs and surrounding areas. The surface and subsurface data presented in the figures are consistent with the data presented in the Remedial Investigation Report for OU-1/OU-2 of the Anniston PCB Site, Revision 3 (OU-1/OU-2 RI Report; ENVIRON, 2015).

3.0 ROLES AND RESPONSIBILITIES

3.1 General

The majority of the area subject to this SMP is located within municipalities and or floodplains where the local governments have permitting authority over most construction activities. P/S will rely upon notifications from the local governments, as described in the following sections, to track land-disturbing activities. However, some of the residential properties fall within unincorporated Calhoun County, which has no such permitting program. P/S will coordinate with Calhoun County's Environmental Enforcement Officer under the provisions of the Public Nuisance code of Alabama to track and identify land-disturbing activities within these areas. P/S will work with the county to notify property owners in these unincorporated areas regarding the status of their property.

3.2 Pharmacia/Solutia

Implementation of this SMP is the responsibility of P/S and will be part of P/S' long-term residual management program. Activities conducted under this plan will be self-implemented and reported by P/S. Requirements for documentation and reporting are included in this SMP.

P/S will review and ensure that the appropriate controls are in place before, during, and after land-disturbing activities that are subject to this SMP. P/S will maintain records of all activities conducted and will update the contact names of the various entities included in this report (at least once per year).

P/S will have a representative to oversee soil disturbance activities in the areas subject to this SMP. P/S' representative will be qualified by education, training, or experience to review proposed work in areas subject to this SMP for potential risks; risk controls; soil management and disposal requirements; and compliance with applicable environmental laws, regulations, and industry standards. For land-disturbing activities proposed in areas subject to this SMP, as described in Section 1.0, P/S will be responsible for reviewing plans and documents, and advising the project implementer on the appropriate methods or controls for the work with regards to handling and managing PCB-containing soil.

3.3 Local and County Governments

This SMP covers areas of the cities of Anniston, Hobson City, and Oxford and unincorporated portions of Calhoun County. The majority of the geographic area covered by this SMP is governed by permitting obligations that require notification to the local governments when construction, repair, alteration, additions, etc. are anticipated within the specified areas.

For the purpose of this SMP, these local and county officials will be responsible, through a Memorandum of Agreement (MOA) with P/S, for ensuring that entities requesting a permit to perform or contract intrusive work within their jurisdictional boundaries or those self-performing work are familiar with the

potential environmental conditions existing within the areas subject to this SMP. An example of this MOA is provided in Appendix C. These governmental permitting offices will confirm that P/S have been informed of the proposed project. This is required for P/S to provide the necessary technical and regulatory guidance to the permit applicant for the proper management of PCB-containing soils within the Site once the permit application is approved and the proposed work is determined to be subject to this SMP.

P/S will make copies of this SMP available and will maintain communication with local government officials responsible for implementing or permitting construction or building projects. The MOA requires the local and county governments to:

- notify P/S within two (2) days of becoming aware of a proposed land-disturbing activity in affected areas;
- meet periodically with P/S to review the implementation of the program (at least annually but may be held more frequently at the discretion of P/S); and
- agree to periodic audits by P/S of the implementation of the Notification Program.

These officials will include permit issuers and the floodplain administrators (FPAs) for the City of Anniston, the City of Oxford, Hobson City, and Calhoun County. A list of current contacts for these government entities is included in Table 2.

P/S will keep each party apprised of the requirements of this SMP in reference to land-disturbing activities. P/S will communicate with local government officials and the persons responsible for permitting or for implementation of land-disturbing activities on an annual basis to ensure that regardless of changes in staff, each party continues to be aware of the potential sensitive environmental conditions existing within their jurisdictional boundaries and is familiar with the requirements of this SMP and the executed MOA. P/S will ensure that each party is aware of P/S' contact information and procedures for communication with P/S.

3.3.1 City and County Engineers

The City of Anniston and the City of Oxford have resources responsible for reviewing proposed construction projects and utility work. The Public Works Department of the City of Anniston reviews and approves plans and specifications for construction and environmental projects in Anniston including site plans, subdivisions, utilities and roadways. A building permit is required in the City of Anniston on all non-federal construction, remodeling, and/or repair projects where the total project cost is in excess of $1,000. The City Engineer coordinates construction activities in the city rights-of-way, and acts as the city's FPA. Similarly, the City of Oxford's Building Department issues permits for any repair, alternation, addition, fences, outdoor storage buildings, pools, decks, carports, etc. that have a value of $500 or more within its

city limits. Hobson City has a similar permitting program that it administers with support from the City of Oxford. The county engineer in Calhoun County is responsible for reviewing and issuing permits to perform utility work on county rights-of-ways. As a result of these permitting programs, these local governments are aware of potential land-disturbing activities to be conducted within their jurisdictions. Owners or developers conducting work without such permits are in violation of city laws and ordinances.

Ultimately, the local and county permitting officers will review and approve requests for land-disturbing activities. As a condition of the proposed MOA, the local permitting authority will consider the need for applicants to coordinate with P/S in accordance with this SMP due to the potential to disturb PCB-containing soil.

The contact information for the various engineering or environmental contacts for the areas subject to this SMP is included in Table 2.

3.3.2 Floodplain Administrators

In addition to the city and county engineers, floodplain management is the operation of a community program that includes corrective and preventative measures designed to reduce flood damage. A community's agreement to adopt and enforce floodplain management ordinances, particularly those addressing new construction, is an important element in making flood insurance available to home and business owners. Currently, the City of Anniston, the City of Oxford, Hobson City, and Calhoun County have voluntarily adopted and enforce local floodplain management ordinances. Floodplain ordinances provide building standards for new and existing development designed to reduce losses from floods. As a result, the communities are aware of potential activities to be conducted within the floodplain. A local FPA for each jurisdiction is responsible for administering the local ordinances in the area. Current contact information for the local FPAs is maintained by the Alabama Department of Transportation (ALDOT)[1].

The contact information for the various FPA contacts for the areas subject to this SMP is included in Table 2.

3.4 Linear Facilities

In addition to the local governments, there are utilities, ALDOT, pipeline companies, and the owners of other linear facilities that routinely operate within the geographic area of this SMP. These entities have assets that are located in the area that will require maintenance, repair, upgrades and/or new lines that involve intrusive activities. In accordance with the MOA, these entities will be responsible to inform P/S when land-disturbing activities will occur within the area subject to this SMP prior to initiating the project,

[1] http://www.dot.state.al.us/dsweb/Roadway/doc/Flood%20Plain%20Administrators.pdf

and that self-performed or contracted intrusive work completed within the geographic extent covered by this document is completed in accordance with requirements of this SMP.

The contact information for these entities is listed in Table 3.

3.5 Contractors, Developers, and Property Owners

Contractors, developers, and property owners who will not be a party to an MOA (i.e., project implementers), but fall within the jurisdictions of local governments that are partners in the MOA, will be informed of the potential environmental conditions existing within the areas subject to this SMP.

Additionally, the project implementer will be responsible to work with P/S in accordance with Section 4.0 of this SMP to safely manage PCB-containing residual soil that may be encountered at the project site.

4.0 SOIL MANAGEMENT PLAN

All parties conducting land-disturbing operations within areas subject to this SMP must be made aware, as indicated in the previous sections, that there is a potential for encountering PCB-containing residual soils and must understand the soil management procedures described in this section. This section of the SMP describes the procedures for managing PCB-containing soil, and how P/S will work with project implementers to support the management of these soils.

All land-disturbing activities subject to this SMP will follow the process described below. Any deviations from the process described will be documented in the project files and as part of the project completion reports.

4.1 Notification of Activities Subject to this SMP

Notification to P/S of the occurrence of land-disturbing activities may be from the local or county permitting agencies, and/or from the project implementer as described in the previous section. Additionally, such notifications may also come from the owners of individual properties addressed as part of OU-1/OU-2. Upon notification of a project that includes land-disturbing activities, P/S will cross reference the location of the project with the OU-1/OU-2 boundaries as well as with the property information and data already included in P/S' database to determine if the property is subject to the requirements of this SMP (see Appendix B). P/S will evaluate if the planned activity has the potential to impact PCB-containing residual soil. If so, a P/S representative will meet with the project implementer to discuss the upcoming activities. If not, P/S will record the communication in the project files and close out the notification request. An example notification record form is included in Appendix D. If land-disturbing activities will be conducted that are subject to this SMP, a P/S representative will work with the project implementer to complete the project in accordance with this SMP.

4.2 Exemptions

The following activities will be exempt from the requirements of this SMP:

- If an intrusive activity occurs within the OU-1/OU-2 area as defined by this SMP and the corresponding area to be disturbed is determined to pose a de minimis risk (i.e., the activity generates less than one cubic yard of excavated soil) the activity will be excluded from the requirements of this SMP.
- For residential properties where an existing structure is removed, if the original sample areas had a maximum PCB concentration less than 10 mg/kg and the footprint area of the structure removed is less than 10 percent of the entire property, no further action is necessary.
- If a residential property is located within an area zoned for light manufacturing, heavy manufacturing, industrial, or other nonresidential use, no further action is required at the property to address residential clean-up goals if a house is not present as it would no longer be considered residential use.

4.3 Pre Land-Disturbing Activities

Once P/S have confirmed that the proposed land-disturbing activity is subject to this SMP, a P/S representative will convene a meeting at the subject property with the project implementer to discuss the proposed activity. The following will be discussed in the meeting:

- exact location on the property where land-disturbing activities are proposed;
- type of intrusive activity to be performed;
- schedule for conducting the land-disturbing activities;
- available engineering drawings depicting the work;
- available data within or adjacent to the work area;
- worker health and safety;
- potential sampling within the intrusive work activity area;
- procedures for handling PCB-containing residual soils; and
- procedures for managing PCB-containing residual soils generated from the land-disturbing activities.

As part of this meeting, the P/S representative and the project implementer will inspect the project site to physically identify areas of the proposed work that may be subject to the requirements of this SMP. The objective of this site meeting and project walk-through is for P/S to get a complete understanding of the project requirements and how the proposed land-disturbing activities may impact residual PCB-containing soil at the site. Additionally, P/S will evaluate whether PCB-containing residual soil will be generated for off-site disposal and, if so, will support the management of these soils according to Section 5.0.

The P/S representative may recommend to relocate the proposed work area to an area that is not impacted with PCBs (typically a higher elevation) or to modify the project to minimize the disturbance of PCB-containing residual soil. In certain cases, it may not be practical to modify the project.

If the P/S representative determines that the risk of contact with PCB-containing soil is low and no PCB-containing residual soil require off-site disposal, as described in Section 5.0, P/S may determine that the project can be completed without further oversight or involvement by P/S. In such instances, P/S' representative will document the findings in the Site files and close out the notification request (see Appendix D). However, the project implementer must be aware of the requirements of this SMP and should contact P/S in the event that the proposed land-disturbing activities change.

4.4 Pre-Characterization Sampling

P/S' representative will determine the need for additional sampling and analysis for PCBs based on the availability of existing data, the location where work is to be performed, and the extent of the area to be disturbed. P/S will work with the project implementer to confirm locations of land-disturbing activity and

determine appropriate sample locations. P/S will stake and locate each sample location using a global positioning system (GPS). Prior to commencement of sampling, the Alabama 811, one-call system, will be contacted to provide standard mark outs.

Pre-characterization sampling will be conducted on 50-foot centers in areas where intrusive work is to be performed, unless P/S determine that a larger spacing would be appropriate. In such cases, the spacing may be increased up to a maximum of 100-foot centers. Borings will be advanced using either a Geoprobe® direct push drill rig or a hand auger. Samples will be collected from 0-12 inches and 12-24 inches below ground surface (bgs) followed by samples collected at subsequent 2-foot depth intervals (e.g., 2 to 4 feet bgs, 4 to 6 feet bgs, etc.). Samples will be collected from each interval and analyzed for PCBs at 1 and 50 parts per million (ppm) using the immunoassay field screening method (EPA Method 4020). The termination depth at each sample location will be based on the greatest depth of land-disturbing activity proximate to the sample location or when field screening analyses indicate PCB concentrations below 1 ppm, whichever occurs first. Confirmation by fixed-base laboratory analysis using EPA Method 8082 will be performed on ten percent of the field-screening samples. All sampling and field screening will be performed in accordance with the Site-Wide Health and Safety Plan (ARCADIS, 2004) and the Site-Wide QAPP (ARCADIS, 2008). All sampling equipment will be decontaminated after each use following the completion of work.

Soil samples may be analyzed by the Toxicity Characteristic Leaching Procedure (TCLP) for waste characterization purposes if industrial operations have historically taken place on the subject property. Depending on the results of these analyses, P/S will not take responsibility for further characterization and ultimate disposal of any waste materials generated. For such cases, P/S would take responsibility and provide support to address the PCB impacts at the property, but would require the owner and/or developer to take responsibility for the other constituents found at the site that are unrelated to P/S' past activities.

4.5 Removal Action Work Plan

Once the pre-characterization sampling data are available, P/S will meet with the project implementer to discuss the results, discuss impacts on the project, and evaluate options for completing the project. Again, P/S' representative may recommend to relocate the proposed work area or to modify the project to minimize the disturbance of PCB-containing residual soil. At this time, P/S and the project implementer will determine if further construction support is required by P/S. If confirmed, the work will be conducted in accordance with this section of the SMP as outlined below. These measures will be implemented specifically to address PCB-containing soil disturbed on the property.

4.5.1 Health and Safety

P/S will notify the owner and project implementer about known concentrations of PCBs within and adjacent to the proposed work area.

4.5.2 Soil Erosion and Sedimentation Controls

Sediment and erosion control procedures will be put in place by the project implementer to reduce the potential release and discharge of pollutants to state waters as required by State of Alabama National Pollutant Discharge Elimination System (NPDES) regulations. Specifically, within areas impacted with PCB-containing soil, stormwater will be diverted from the affected work areas during all proposed construction activities. Silt fence and hay bales, as appropriate, will be placed around the perimeters of the proposed areas to be disturbed. These controls will be documented in the Construction Best Management Practices Plan (CBMPP) prepared by the project implementer. Soil stockpiles, if used, should be placed on top of plastic sheeting and managed in a way that will not cause soils to erode from the stockpiles and be transported by storm water runoff. If any dewatering is required in impacted areas, all such water will be pumped through a filter bag prior to discharge.

Other best management practices (BMPs), including decontamination pads, may be necessary depending on the nature and location of the proposed project—as determined by the project implementer and P/S' representative. Used BMP materials will be properly disposed at approved solid waste handling facilities.

Soil loaded into transport vehicles for off-site disposal will be covered with tarps or other covering to minimize emissions into the atmosphere. The covering will be in good condition, joined at the seams, and securely anchored.

4.5.3 Equipment Decontamination

Equipment used for the excavation and loading of PCB-containing residual soils, and trucks where residual soils are loaded should be decontaminated as specified herein. This will typically include dry brushing the equipment in a designated decontamination area covered with plastic before it leaves the project area to minimize the spread of contaminants. Dry brushing/scrubbing is done with long-handled wire brushes, rods, and shovels for dislodging soil caught in tires, buckets, and undersides of vehicles and heavy equipment. Soil removed from equipment and trucks will be handled according to the procedures set forth for the project as outlined on Section 5.0. Equipment and vehicles will be inspected and documented by the project implementer prior to leaving the site to ensure that proper decontamination has been performed.

4.5.4 Site Restoration

After completing the land-disturbing activities, all excavations will be backfilled with soil appropriate for reuse or clean fill material. In areas where PCB-containing soil will remain on site, a minimum 12-inch clean cover will be placed over the area by reusing excavated materials with PCB concentrations less than 1 mg/kg or clean fill materials. A nonwoven geotextile marker layer will be placed beneath the proposed soil cover. If borrow source material is required for site restoration, P/S will evaluate the suitability of the borrow source material prior to utilizing on the project. All areas will be stabilized following the completion of the land-disturbing activities.

4.6 Quality Assurance and Quality Control

Certain Quality Assurance/Quality Control (QA/QC) documentation and testing will be performed during construction activities to confirm that the work is performed in accordance with this SMP. Generally, QA/QC documentation and testing may be required for the imported fill material to confirm its source and the absence of contamination. Manifests will be maintained for outgoing soil/debris. In the event there are any deviations from this SMP, P/S will document such changes for the Site records.

5.0 PROCEDURES FOR MANAGING PCB-CONTAINING SOIL

P/S will be required to address residuals that are generated by excavating soil as part of conducting land-disturbing activities within impacted areas. P/S' representative will evaluate decisions regarding waste management and disposal based upon available data on and adjacent to the property being addressed. In some cases, additional data collection may be warranted if sufficient waste characterization data are not available. The following criteria should be used to manage soils excavated as part of these activities.

- PCBs greater than or equal to 50 mg/kg
  - Off-site disposal at a TSCA-approved landfill
- PCBs greater than or equal to 1 mg/kg and less than 50 mg/kg
  - No net removal – No further action (all excavated soil must be placed back into the excavation from which it was removed and the material must be overlain by a geotextile marker layer and a minimum of 1 foot of clean fill material)
  - Net removal – disposal at approved municipal solid waste landfill facility, e.g., Three Corners
- PCBs less than 1 mg/kg PCBs
  - No further action

Soil samples may be analyzed by the TCLP for waste characterization purposes if industrial operations have historically taken place on the subject property. The results of these analyses will be considered when determining the ultimate disposal of the soils generated.

When off-site disposal of PCB-containing residual soil is required, P/S will coordinate the removal and disposal of the soils generated during the land-disturbing activity. Soils will be contained (i.e., lined or unlined roll-off container), staged and transported to the appropriate disposal facility based on the measured PCB concentrations.

If additional data are required during the land-disturbing activity as determined by P/S' representative, field screening will be performed using immunoassay screening techniques (EPA Method 4020). Confirmation by fixed-base laboratory analysis using EPA Method 8082 will be performed on ten percent of the field-screening samples. During excavation, soils will be segregated based on pre-characterization data and/or field screening results collected during implementation. Based on the measured PCB soil concentrations, P/S' representative will direct the project implementer regarding handling of the residual soil.

P/S' representative will maintain a daily soil management log to record the following information as PCB-containing residual soil is excavated:

- project and land-disturbing activity locations;

- stockpile or container location, description and/or designation;
- estimated stockpile or container volume;
- start and finish date of land disturbance activity;
- sample(s) collected from stockpile or container and field screening performed;
- description of measures employed for erosion and dust control;
- detail of soil usage/disposal from each stockpile or container, and
- notes/comments.

P/S' representative will record the location of stockpiles and containers on a map. No containers, stockpiles or portions of a stockpile will be allowed to be moved or relocated without prior approval from P/S' representative.

If P/S conduct any work at the Site using its own resources, P/S will confirm that the Alabama Line Location Center (1-800-292-8525 or 811 [the Alabama 811 Service or the "One Call" service]) has been contacted by the project implementer prior to any intrusive activity.

6.0 PROJECT IMPLEMENTATION AGREEMENT

As required on a project-specific basis, P/S will prepare a project implementation agreement to be signed by P/S and the project implementer. The project implementation agreement will provide the parties with a written agreement documenting the work that will be performed by each party, permitting responsibilities, schedule requirements, and the allocation of cost amongst the parties. P/S may provide resources to perform certain activities (i.e., construction-related activities) on the project work site, but typically the project implementation agreement will provide the terms for P/S to arrange and manage the off-site disposal of impacted soil. All work conducted by either party will be performed in accordance with this SMP and the project implementation agreement.

7.0 REPORTING

Once the project has been completed in its entirety, P/S will prepare a completion report documenting the work that was completed. The report will include a brief cover letter and the following attachments:

- a table summary of the analytical testing performed;
- a map of field sampling/screening locations and results, as appropriate;
- an overall map, with the project location and location(s) of soil disturbance, soil removal, soil reuse, and/or placement of imported soil;
- volumes of soil reused on site along with surveyed or GPS coordinates, indicating the location(s) where such soil was placed;
- construction daily reports and photographic log;
- dust monitoring data, if required;
- as-built survey of any caps or covers constructed as part of the project;
- a summary of any deviations noted from this SMP;
- analytical data for imported soil placed on site, if appropriate; and
- waste manifests for off-site disposal.

The reports will be kept at the Facility, and a summary of the activities described in the reports will be included in the CERCLA 5-yr reviews. The EPA will have the opportunity to review the soil management activities conducted as part of the 5-yr review.

(1) Exposure point concentration (EPC) is the lower of the maximum concentration and the 95% Upper Confidence Limit (UCL) or 9th Percentile.

(2) Total PCBs calculated using sum of the detected Aroclors when at least one Aroclor was detected or maximum practical quantitation limit for nondetected Aroclors when none of the Aroclors were detected.

(3) Highlighted values indicate EUs where the EPC is less than 1 mg/kg. Soil management is not required within those EUs.

Source: ENVIRON. 2015. Technical Memorandum on Remedial Action Objectives, and Remedial Technologies, Alternatives and Screening OU-1/OU-2 of the Anniston PCB Site Revision 1. April.

EPC: exposure point concentration
EU: exposure unit
mg/kg: milligram(s) per kilogram
N/A: not available
PCB: polychlorinated biphenyl

Table 2: Local Government / Permitting Agencies Contacts
Anniston PCB Site, Anniston, Alabama

Agency Address	Engineering/ Environmental or FPA Contact	Phone Number
Alabama Department of Transportation Office of Environmental Coordination 1409 Coliseum Boulevard Montgomery, Alabama 36110	Barry Fagan, PE/PLS, CPESC Environmental Program Engineer	334-353-6972
	Mr. Adam S. Anderson, P.E. Environmental Analysis and Compliance Engineer	
Calhoun County Emergency Management Agency (EMA) 507 Francis St. W. Jacksonville, AL 36265	Jonathon Gaddy EMA Director / FPA	256-435-0540
Calhoun County Highway Department 160 Seaton Drive Anniston, Alabama 36205	Brian Rosenbalm County Engineer (Utility Permits)	256-237-4657
Calhoun County Environmental & Enforcement Office 1702 Noble Street, Suite 101 Anniston, AL 36201	Environmental & Enforcement Officer	256-241-2942
City of Anniston 1128 Gurnee Avenue Anniston, Alabama 36201	Lance Armbrester City Engineer/FPA	256-231-7750
	Don Hoyt City Manager	256-236-3422
City of Oxford P.O. Box 3383 145 Hamric Drive East Oxford, Alabama 36203	Mike Roberts Chief Building Official (Building Permits)	256-831-9685
	Shane Strickland FPA	256-310-2925
	Rusty Gann City Engineer	256-835-0574
Hobson City 715 Martin Luther King Dr. Hobson City, Alabama 36201	Alberta McCrory Mayor / FPA	256-831-4941

FPA: Floodplain Administrator

P.E.: Professional Engineer

CPESC: Certified Professional in Erosion and Sediment Control

PLS: Professional Land Surveyor

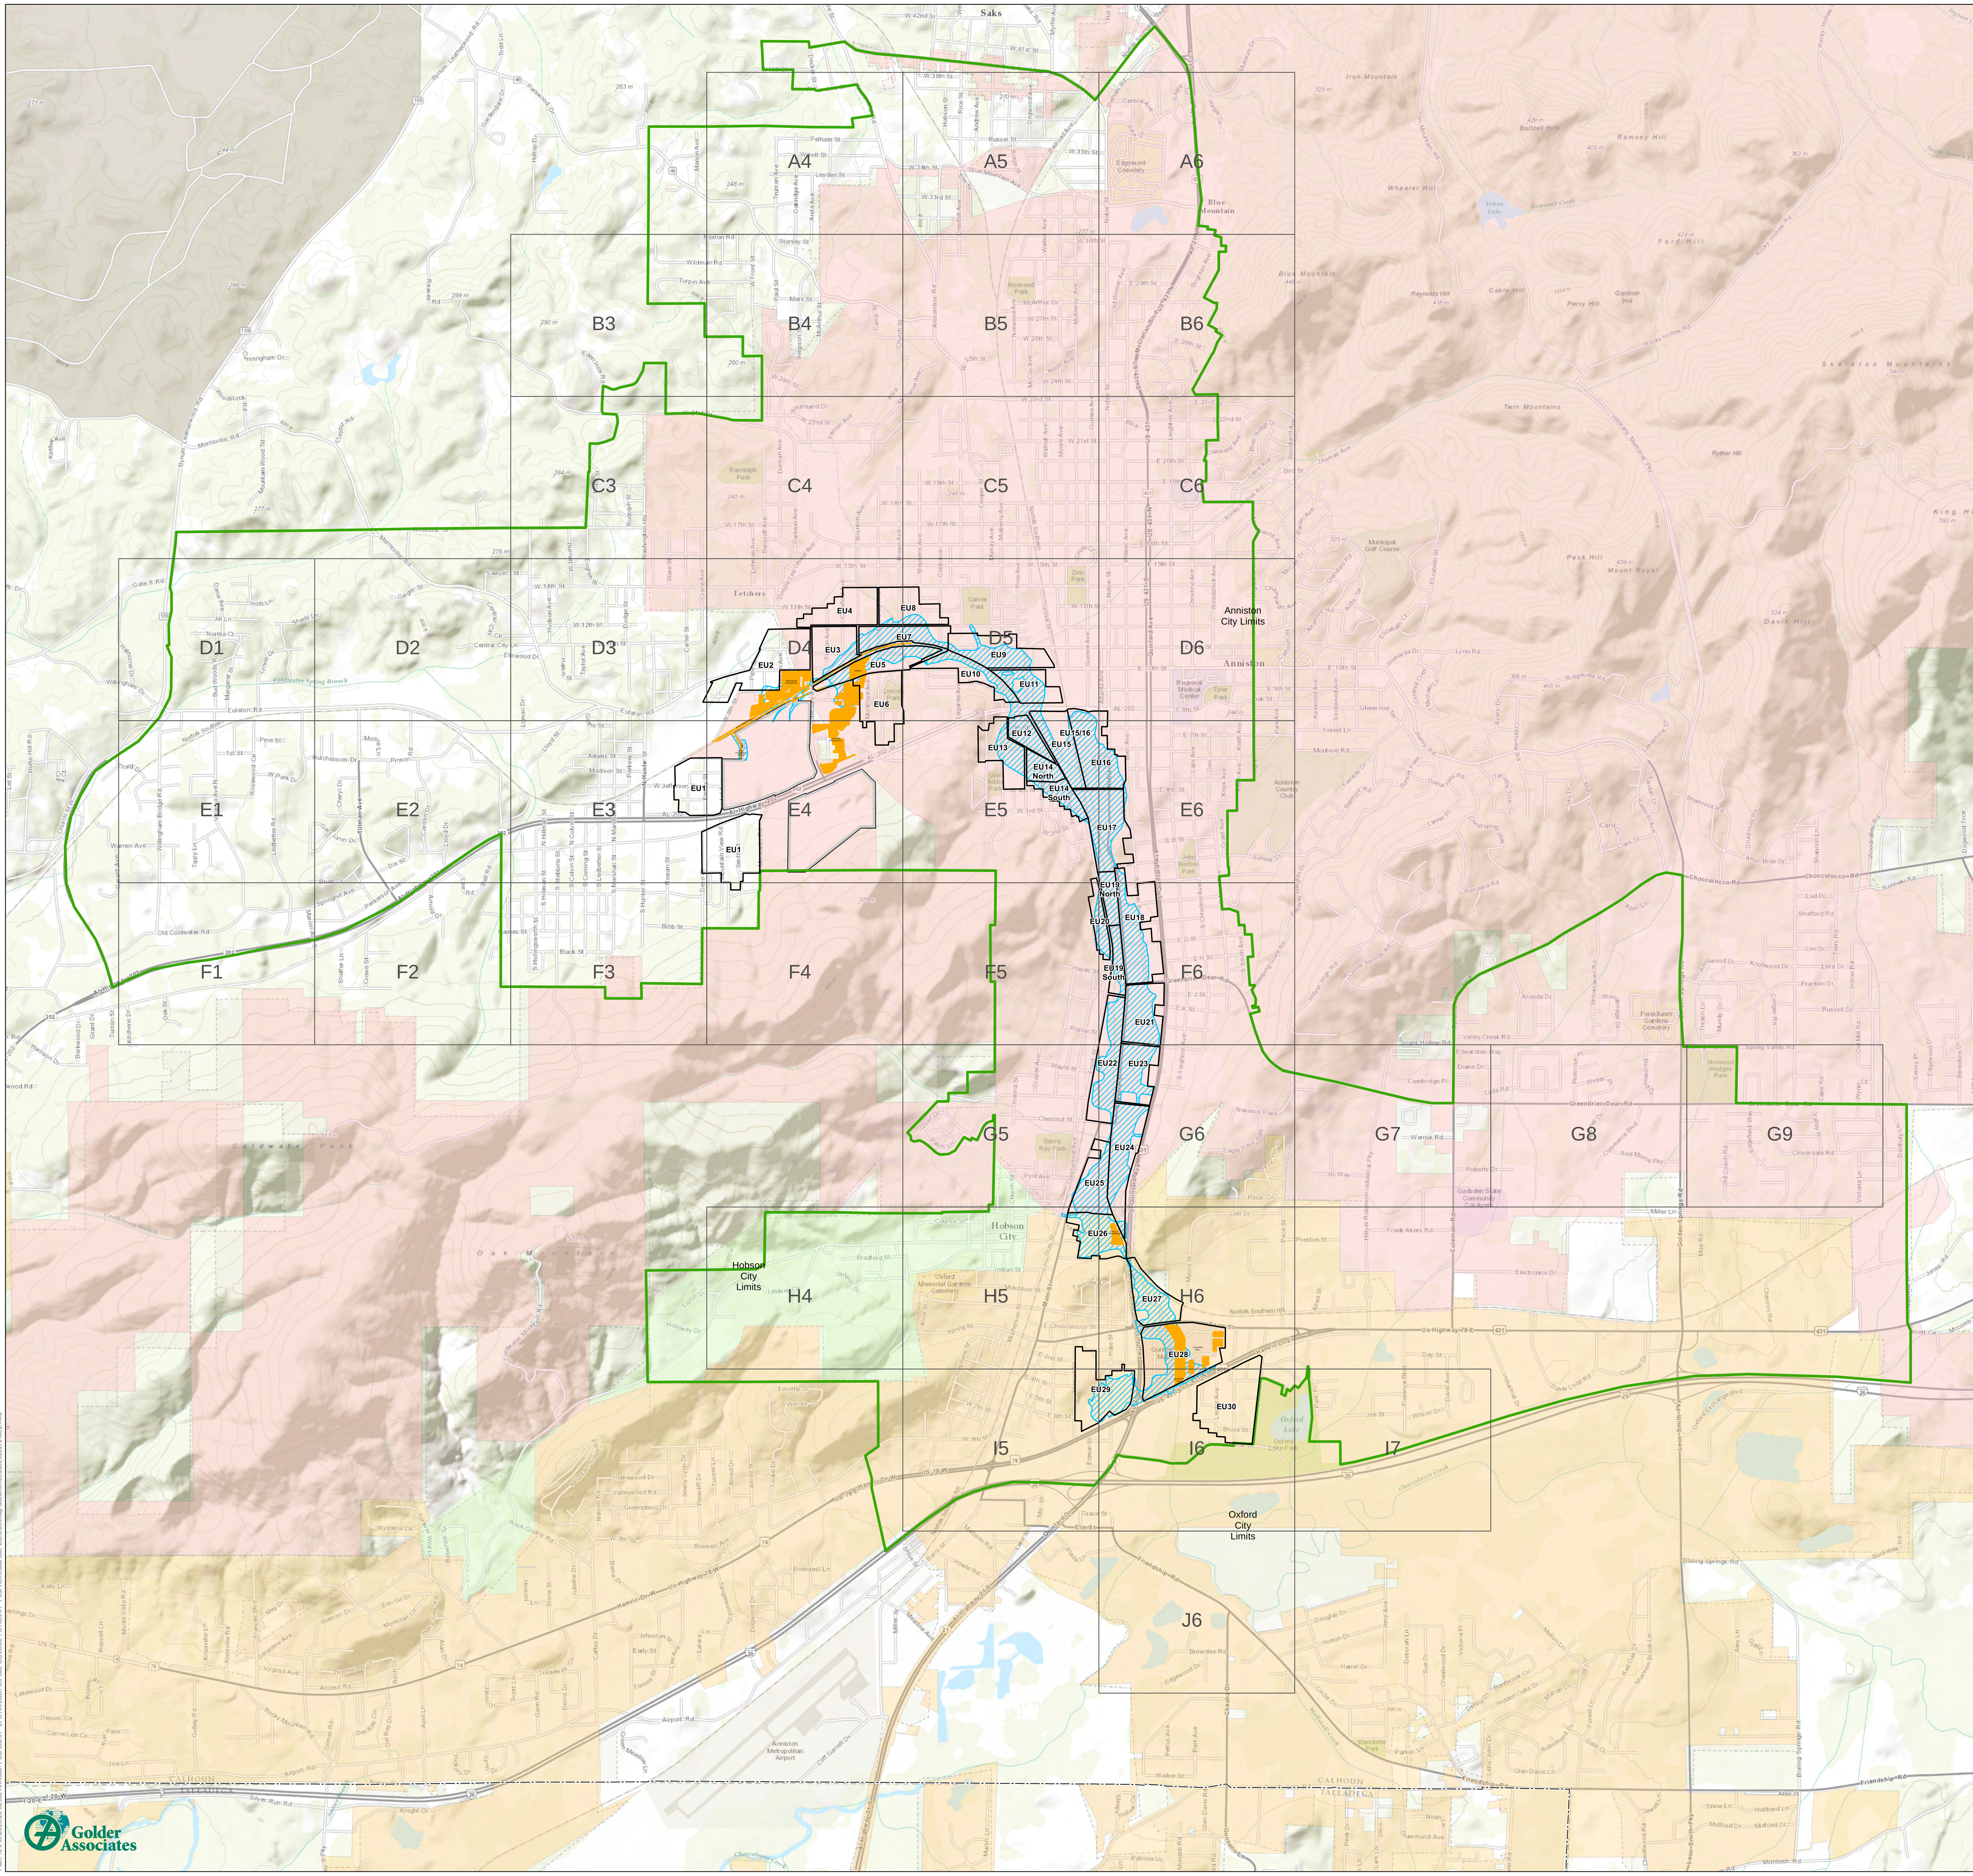
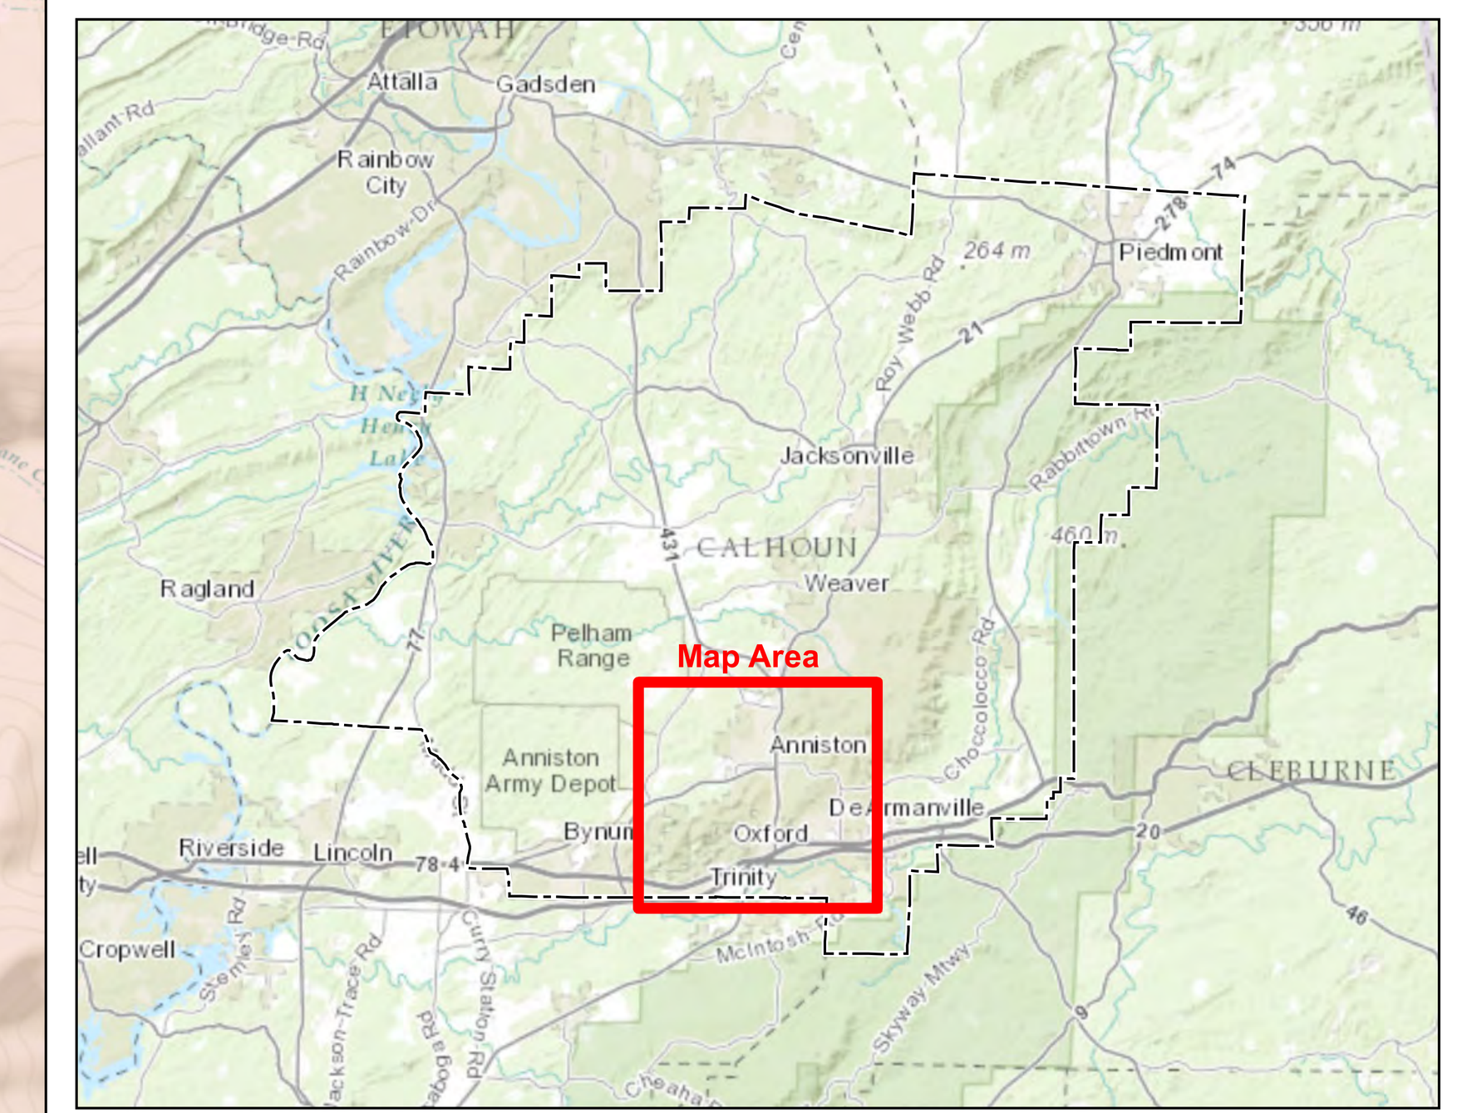
APPENDIX B
SOIL MANAGEMENT PLAN KEY MAPS AND MAP BOOKS

APPENDIX B-1
OU-1/OU-2 KEY MAP



OVERVIEW - CALHOUN COUNTY



LEGEND

- Map Book Identification Grid
- OU-1/OU-2 Exposure Unit
- EPA Zone B
- Interim Measure Area
- OU-3 Boundary
- OU-1/OU-2 Downgradient Floodplain
- County Boundary
- Anniston City Limits
- Hobson City Limits
- Oxford City Limits

NOTES

1. The extent of the grid in this figure includes EPA Zone B as defined in the Lead Site AOC and the Stipulation and Agreement.
2. The responsible parties for the Anniston Lead Site have primary responsibility for sampling in EPA Zone B, and for completing removal actions at any properties with lead concentrations in soil greater than or equal to 400 mg/kg. P/S have responsibility for properties within EPA Zone B only if the property has lead concentrations in soil less than 400 mg/kg and PCB concentrations greater than 1 mg/kg.
3. Contact the EPA for additional information on residential sampling activities in EPA Zone B.
4. Interim Measures are being addressed as part of the long-term Operations and Maintenance Program for the Site.

AOC: Administrative Order on Consent
APCO: Alabama Power Company
CSSMA: Central Soil Staging and Management Area
EPA: United States Environmental Protection Agency
EU: Exposure Unit
IM: Interim Measure
mg/kg: milligrams per kilogram
OU: Operable Unit
P/S: Pharmacia LLC and Solutia Inc.
PCB: polychlorinated biphenyl

APPENDIX C
MEMORANDUM OF AGREEMENT

EXAMPLE

Memorandum of Agreement (MOA)

between

Pharmacia LLC and Solutia Inc.

and

_____

I. Purpose

a. This Memorandum of Agreement (MOA) is entered into between Pharmacia LLC and Solutia Inc. (collectively, "P/S") and _____("_____").

b. This MOA establishes a procedure for _____ to notify P/S of potential or planned "Land-disturbing Activities" (as defined below) that may take place generally within the 100-year floodplain of Snow Creek from Solutia Inc.'s facility located at 702 Clydesdale Avenue downstream to Highway 78 (the "Soil Management Area") as described in Section II.

c. This MOA is intended to assist P/S' implementation of a Soil Management Plan (SMP) to manage polychlorinated biphenyl (PCB) residual soils that may be generated from land-disturbing activities occurring within the Soil Management Area.

d. As used in this MOA, "Land-disturbing Activities" mean grading, excavation, trenching, or utility installation or repair that could potentially relocate PCB residual soils. Examples of such activities include, but are not limited to, road widening, pipeline installation, foundation construction, utility work, demolition of structures at or below the ground surface, or other construction activities requiring excavation and potential exposure to soils containing PCBs. The SMP includes procedures for implementing a safe soil management program by using protocols for P/S to follow when notified that a land-

disturbing Activity is planned within the Soil Management Area. This MOA does not in any way grant or otherwise create any rights, obligations, responsibilities, expectations, or benefits for any person, and does not in any way affect P/S' responsibilities under state or federal law.

II. Scope of this Agreement

a. The Soil Management Area is depicted on Figure 1 and Appendix B of the attached SMP.

III. General Provisions for the Notification Program

a. _____agrees to promptly communicate to P/S all land-disturbance activities that may be subject to this SMP within two (2) days of becoming aware of the proposed activity. Such communication will be sent to the P/S Point of Contact identified under Paragraph ___ of this MOA.

b. The communication shall include site location or address, including coordinates and/or tax block and lot(s) if available, and the reason for _____'s belief that the site may be subject to the SMP, and any additional data or information supportive of this belief.

c. The format for transmitting this information will be established between P/S and _____.

IV. Technical Assistance by P/S

a. The procedures for P/S' technical assistance are set forth in the SMP, attached to this MOA, and incorporated herein by reference.

V. Implementation of Notification Program

a. P/S will meet periodically with _____for the purpose of reviewing _____'s implementation of the Notification Program. Such meetings shall occur at least annually but may be held more frequently at the discretion of P/S.

b. _____agrees to a periodic audit by P/S of its implementation of the Notification Program and this MOA for the purpose of determining conformance with the terms of this Agreement.

VI. Modification and Termination

a. This Agreement will be in effect for _____years following its execution.

b. P/S may request an extension of this MOA within 3 months prior to the expiration of this MOA.

c. _____ will not unreasonably withhold an extension.

d. Terms of this MOA can only be modified in writing, signed by both parties.

e. This MOA can be terminated upon 90 days written notice by either party.

VII. Points of Contact

a. The following individuals have been identified as points of contact:

For P/S:

Environmental Manager: _____

Address: Solutia Inc.

702 Clydesdale Avenue

Anniston, Alabama

Phone Number: _____

Cell Phone Number: _____

E-Mail Address: _____

For _____

Project Manager: _____

Address: _____

_____

_____

Phone Number: _____
